SPECIFICATIONS OF POWDER BED FUSION (PBF) POLYMER 3D PRINTER (SLS)

1. Description		
a.	Powder Bed Fusion (PBF)	Powder Bed Fusion (PBF) 3D printing technology spawns products with precision. This 3D printing technique enables the manufacturing of a vast array of geometrically complex products using a heat source, mainly laser or electron beams, to fuse powder particles layer-by-layer, therefore forming a solid part. Manufacturers can benefit from substantial freedom of design considering that PBF presents several viable technologies and materials.
b.	Selective Laser Sintering (SLS)	<p>The SLS process uses lasers to sinter, or coalesce, powdered material layer-by-layer to create a solid structure. The final product, rendered enveloped in loose powder, is then cleaned with brushes and pressurized air.</p> <p>The main materials used in the SLS 3D printing process include polyamide (Nylons), Alumide (a blend of gray aluminum powder and polyamide), polystyrene and rubber-like materials such as Thermoplastic Polyurethane (TPU).</p> <p>Nylons are strong and durable and feature some flexibility, making them excellent for snap fits, brackets, clips, and spring features. Polystyrene (PS) for complex investment casting patterns.</p>
